In particular, the invention relates to a backlight system for a thin film transistor liquid crystal display (TFT-LCD) of the active matrix type. In a TFT-LCD, a liquid crystal layer is interposed between two parallel glass plates which have an array of pixel electrodes and thin film transistors (TFTs) associated with each pixel electrode. When a voltage is applied to the pixel electrodes, the liquid crystal molecules are re-arranged, and the resulting optical modulation causes a change in the optical properties of the liquid crystal layer which in turn can be seen as a display. The light sources used in the display are often a combination of a cold cathode fluorescent lamp (CCFL) and a fluorescent layer placed on the ca3bf1094
