
Comprodtv4downloadwindows10 UPDATED

is there something wrong? A: From your output it looks like a page has been redirected to a different domain, I suggest you take a look at the URL and try and find out why it is redirected.

Make sure that your web browser is not configured to protect against redirects and do take a look at the URL of the page you are trying to open. Q: Python 2.7.6: ValueError: could not convert string to float I have a program that calculates chemical potential and is full of problems, here is a sample line: `avrg = 0.5 * g + 1` I have a Traceback error which I tried to resolve it, but I only found that I have ValueError: could not convert string to float. I tried to fix it with `float.fromstring` function. `avrg = float.fromstring("0.5 * g + 1")` I already looked at this post: and I still don't know how to fix it. Any help is appreciated. I also tried this program: `import math a = "1.0" b = "0.0" c = "0.0" d = "0.0" e = "0.0" avrg = 0.5 * g + 1 print math.log(a/b) print math.log(a/c) print math.log(a/d) print math.log(a/e)` This is what I have gotten from print: Traceback (most recent call last): File "C:/Users/wiedevon/PycharmProjects/Probability/New Test.py", line 17, in `avrg = 0.5 * g + 1` ValueError: could not convert string to float: '1.0 * 0.0 + 0.0' A: From the documentation: If base is a string, it is interpreted as a number base by choosing the one closest to the mathematical construction of the output. The default base is 10, but it can be changed. You probably meant `a = 1.0 # * 0.0 == 0.0` not `1.0 * 0.0` EDIT: Well, if you don't want the first base
