The MHC class II transactivator (CIITA) was discovered in 1998, and six members of this family have

been identified to date. CIITA is known to be constitutively expressed as a 9-kDa protein, however in this report, we identified the naturally occurring mouse (Mb) CIITA is attached to the cell membrane as a 74-kDa glycoprotein (MHLA1). MHLA1 is expressed by cells of the myeloid lineage, including monocytes, macrophages, and granulocytes. However, MHLA1 is not present on splenocytes and some cultured murine or human cell lines. Confocal microscopy confirmed the expression of MHLA1, CIITA, and the  $\alpha$ - and  $\beta$ -chains of MHC class II by the HL-60 monocytic cell line. Expression of MHLA1 was not regulated by phorbol esters or by stimulation with IL-1 $\beta$  or CpG oligonucleotides. Interaction studies with MHLA1 revealed that it binds directly to CIITA. MHLA1 is a new addition to the family of MHC class II transactivators. Although this protein bears high sequence similarity to other MHC class II transactivators, it does not contain the lysine-rich transactivation domain present on CIITA and CIITA-related molecules. Our data further suggest that MHLA1 shares some of the functions of CIITA on antigen presentation and may provide the missing link for antigen presentation in the myeloid lineage.
