In order to avoid this tooth erosion, DE 199 64 986 A1 teaches to provide an axle with flexible material portions in the region of the gears in order to avoid tooth erosion. A six wheel steering axle for a motor vehicle is known from DE 24 45 032 A1, wherein the steering axle comprises three steerable rear wheels and three steering wheels. The steering wheels and the rear wheels are connected to one another by a common supporting axle in the form of a universal shaft. The universal shaft is made as a hollow shaft with pressure resistance elements. The universal shaft is therefore made in one piece with the supporting axle as a hollow shaft, and the supporting axle is made as an integral part of the universal shaft as a hollow shaft. An adjustable steering axle for a motor vehicle is known from DE 28 30 753 C3, wherein the supporting axle comprises two U-shaped branches of individual tubes, which are interconnected by a hollow shaft in the form of a universal shaft and wherein the universal shaft is made as a universal hollow shaft and is connected to the two U-shaped branches. The branches are each adjustable in their length relative to one another in opposite directions by means of a separate threaded spindle. A disadvantage of the known steering axle is the large number of parts and therefore the large amount of assembly work. Furthermore, the steering axle must be adjusted in its length while the steering axle is already mounted on the motor vehicle. DE 43 23 650 A1 relates to an adjustable steering axle, wherein the supporting axle comprises two branches in the form of single tube, which are interconnected by a hollow shaft in the form of a universal shaft. The universal shaft is a hollow shaft Occ13bf012
