* ** **The Brush tool****. The Brush tool is one of the most common image editing tools in Photoshop. It allows you to paint and draw, mask, and blur or erase images. For example, you can apply a Blur filter to a selection of the image—just paint. On a particular layer, you can even paint on a layer mask to apply a blur filter that affects only a selected area of the image. This technique is perfect for retouching skin or other areas of an image where you may want to create a blur effect. *

** **The Filter tool****. You can apply dozens of different filters to an image by using the Filter tool. You can experiment with different effects on different images, as shown in Figure 5-20. In addition to filters, you can apply special effects to an image, such as wipes, vignettes, flares, geometric patterns, and frames. You can even create special effects for your own images by using Photoshop's own built-in filters and special

effects. Photoshop filters can come as preinstalled Extras, or as browser plug-ins that appear as toolbar buttons. * ** **Favorites****. The Favorites tool enables you to create a list of Favorite items that you can access quickly later. The most common way to use Favorites is to create a list of frequently used color schemes and filters. After you've accessed one of these frequently used items, you can apply it to any image, and then click the Favorites tab to open a window with all your favorite items. * ** **Layer styles****. This tool enables you to apply a set of special effects to the layer masks of a given image. The effects include drop shadow, bevel, and many others. FIGURE 5-20: You can apply filters to a selected area by using the Filter tool.

Jazz up the holidays The holidays are a busy time for most, whether or not the result is a merry, festive season. A few notes of caution: Do not try to fit it all into this time: A few things may need to be delayed or cancelled due to the holiday. But no one can have everything done perfectly on the first try. Try to savor and enjoy the season: Holidays can be stressful. Make time to enjoy the season with family and friends. Plan meals and activities together. You may even enjoy some of the activities available. Make arrangements for those not well enough to be present: Deadlines, especially those that can't be postponed, must be met. It is almost unheard of to mention the loss of a family member or loved one on a holiday; indeed, it can be difficult to talk about the loss and difficult to maintain the good spirit of the holiday. But do consider the following: Do not delay letting someone know if you are having difficulty communicating with them (if you haven't already): This may be of some assistance to them if they are worried about you. Whether or not you are able to spend time with them, don't let their absence prevent you from spending time with their family. Some families can still have a happy, relaxing holiday without them. Try to find a way to take some time for yourself: Christmas is usually a stressful time due to the overload of activities and demands of others. Take some time for yourself to relax and rest; if it means being alone, then be sure that you keep a special book for yourself to read. While you

can't have every special day for yourself, give yourself some special days, such as a day or two to treat yourself well. Consider taking a trip somewhere, relaxing at home, visiting an old friend or relative. Get a massage, go for a hike, have a facial or manicure. Do not forget about those who need you during the holidays: Please don't forget about those who may need you to step in during the holidays. Someone may be sick, you may not be able to help with anything else, there may be people who can't help because of their own family situation, or any number of other reasons. Do what you can to make things better. You can't do everything, but if you can do something, do it

Q: IoC + Unity: The instruction at line 0 referenced memory that the data could not be read or written Hey guys I'm trying to make a simple IoC based MVC+EF6+Unity test application. I have used NuGet to make my app sharable, as well as trying to avoid any hardcoded references. In my Module class, as well as my Func class, I have `_container.RegisterType, UserManagement>()`; In my UserManager class, I have `_container.Resolve>()`; I have every other class in my project to implement UserManagement. Here is my error: `The instruction at line 0 referenced memory at address 00000024 It is an exe I have compiled and ran fine before. I don't know what I did to mess it up. I have searched the net for solutions, but I don't know what the problem is. All I want is to instantiate UserManagement

in my UserManager. I'm open to any information that will help me debug this. A: Solved this. Turns out my Project.json was set up to ignore changes made to the UserManager and the UserManager had not declared that it was public.

A new study of people infected with Ebola may explain why those infected appear to have a better chance of surviving the virus than those who are not. Previously, scientists have only been able to study human data from two large Ebola epidemics, both of which occurred in west Africa. During the recent outbreak in West Africa, researchers were able to look at more than a thousand people in Guinea and Sierra Leone. In the data collected, researchers determined that the prevalence of Ebola in people with sickle cell anemia (SCA) is about seven times lower than in people without SCA, suggesting that SCA may help protect against or reduce mortality in those infected with Ebola. But the data collected in the current outbreak is different from previous data. For the most part, people with sickle cell disease are not living in Ebola treatment centers, and therefore, are not included in the analysis of the large number of people with Ebola. The authors of the new study, published today in Cell, assumed that SCA status could help protect against mortality during an Ebola epidemic, and that data from previous outbreaks might be an unreliable
