Pneumonectomy and postoperative adjuvant therapy in stage I adenocarcinoma of the lung. From January 1, 1975 to August 31, 1985, 61 patients with histologically proven stage I (TNM) adenocarcinoma of the lung were entered onto a randomized clinical study comparing pneumonectomy to combined surgery (pneumonectomy plus anatomic lung resection). Thirty-five patients were entered after 1975 (study group) whereas 26 patients were entered before 1975 (control group). There was a significant difference in the overall survival and median survival time between the two groups; 56 months for the control group and 63 months for the study group ($P = 0.001$). Multivariate analysis revealed that pneumonectomy was the most significant prognostic variable for survival, followed by a good postoperative status of the patient, size of tumor, histology (P less than 0.05). No significant difference in survival was noted between the patients with squamous cell carcinoma and those with adenocarcinoma. The majority of recurrences occurred in the pneumonectomy group; they were generally at least 5 cm away from the previous site of disease. Pneumonectomy resulted in significantly more bronchopleural fistulae than combined surgery. The overall complications of pneumonectomy were comparable to those of combined surgery (P greater than 0.05). Pulmonary complications occurred at a higher rate in the study group than in the control group (P less than 0.05). These findings suggest that pneumonectomy is superior to combined surgery in stage I adenocarcinoma of the lung, with or without adjuvant postoperative therapy.Q: How to access a directory inside another during azure webjob? Q: What does it mean to make a project "open source"? I have been hearing a lot about the term "open source", but I am wondering what that means in practice. By open source does it mean that someone can see the source code? By make a project open source, does it mean that someone can look at the code and someone else build the same thing? A: Open-source projects are usually free software projects, meaning that they are developed by a community and released under a licence allowing for everyone to do what they want with the code. The name is linked to the open-source licence they use (the GPL or the AGPL for instance), giving away the source code on a large scale and making it more likely that others can modify the software without legal consequences. In particular, those projects let all those who follow the licence to either download the source code, modify and redistribute the software, and/or make a derivative work of it (with many licences allowing for more freedom than just a strict copying of the software). Even more in particular, an open-source project can sometimes be written in a way so that only open-source projects can play with it. To make it clear, the one and only licence for open-source projects is the one mentioned above (the GPL or the AGPL), which allows for others to use the source code and/or redistribute it. A project released under a permissive licence, such as the BSD licence, only allows for personal use and redistribution. In this case, the source code will be under a non-free licence, and only allowed for open-source uses (see this diagram) A: I don't know where this question comes from, but if it is for the context of work for the open-source community, then it has to be GNU's definition: "Many open-source projects don't make their source code available in a way that does not prevent anyone from modifying or studying the code. This is called the "open-source" licence. It is a licence that requires anyone who uses the software to make it possible to study and modify the source code. Adherents of open-source licenses are called "open-source software developers." Use a license that allows for free use, such as the GNU public license (GPL), and check the license's documentation for exceptions that allow products with proprietary parts (e.g
