The nation's visa-free arrangements with the U.S. could be a contributing factor. The number of Nicaraguan visitors to the U.S. increased by 47% last year. In 2017, 25,309 travelers from Nicaragua visited the U.S., according to the latest figures from Visit Nicaragua. That's compared to 17,305 visitors in 2016. The number of Nicaraguan travelers to the U.S. more than doubled over the last seven years, the organization said in its October report. As one of the first Central American countries to enter into the VWP, Nicaragua has benefited greatly from the visa-free program. More than half of all travel visas issued for North America in 2017 were the VWP, according to the State Department. On its website, Visit Nicaragua says the visa-free program is one of the "keyest reasons why more and more travel from Nicaragua are entering the United States." Visitors from the United States traveling to Nicaragua must present at least one of the following documents to U.S. immigration officials: A passport, a visa, a valid U.S. driver's license, or a e79caf774b

The C++ implementation will be fairly efficient, but obviously the Java version will take up much less memory, so this decision comes down to, "When do I port between the two?" Right now I've just been feeding any Java array to the C++ code, but this seems pretty inefficient. What is the standard procedure for situations like this? A: If the code needs to be nearly equivalent, don't try to do a clean one-to-one mapping of the classes. For example, if the two versions will need to do multiplication, but the only native 64-bit multiplication operation available in the JVM is in a 32-bit class, use a wrapper that will call through to the underlying 32-bit class. Ideally, you should have a "core" in C++, and then bindings and wrappers in Java and for those things in the Java/Java bindings that you'd rather keep in Java. If the computation is fast enough in Java, you could try a simple JNI approach of calling the function directly, or the invocation function on the JVM with the correct arguments (similar to how you pass a single byte to the GC as a reference, rather than a pointer, to the JVM). A: If you really need to squeeze a lot of performance out of the embedded chip I think it's worth trying a JNI implementation of the algorithm. I've not written one so can't go into much detail but if you were
