Tetrahymena contains phosphoinositides; there are at least two but probably three distinct pools of the polyphosphoinositides. The inositol lipid is mainly in a phosphate-rich form, probably a polyphosphoinositide. Carbohydrates comprise about one third of the total phospholipid. Amino acid analysis of phosphoinositides has also been performed, but the results were inconclusive. Lecithin analysis demonstrated that the inositol phospholipids are directly linked to the glycerophospholipids by a glycerol ester bond. Kinetic studies on the formation of inositol phosphates from myo-inositol indicate that all the inositol phosphates are formed at similar rates. Detailed study on the biosynthesis of inositol phosphates has been limited so far. A membrane-bound degradative enzyme system which hydrolyses the C-1-phosphate of inositol has been isolated and partially characterized. The enzyme, which is calmodulin-sensitive, does not appear to degrade inositol phosphates other than inositol-1,4-bisphosphate, but does not appear to degrade myo-inositol. The enzyme is distinct from the lactate dehydrogenase, isocitrate dehydrogenase and hexokinase. The enzyme was enriched to apparent homogeneity by chromatography on DEAE-cellulose and phosphocellulose. The enzyme was found to be associated with an Occ13bf012
