Aug 02, 1996 Appeal From: N.D.Tex., No. 3:94-CV-296-D 1 AFFIRMED. * Fed.R.App.P. 34(a); 5th Cir.R. 34.2 Q: Null byte's in hexdump text I'm trying to identify which byte is null, if there is one, in this case it's hex 70. When I search for the null byte using a hex editor it is : null byte(0x00), extended byte(0x80) I have tried using the Perl script: my \$str = "CFAA6926FA9AB1110" \$str = "A" x length(\$str) print substr(\$str,1,1) It returns /00, which I figured means there's no null byte. When I try print 1; it returns 0x80, which I feel is the correct number. The string: "A" x length(\$str) Is there any way of searching for the null byte without looking at the hex dump? A: This string is actually longer than 80 bytes (from CFAA6926 to A). The hex dump should be taken as part of the string. It is zero-padded. print length, length(\$str), substr(\$str,1,1), "0x\$length"; CFAA6926FA9AB1110 is 80 bytes. We're going to assume that most of you reading this aren't precisely nth generation Atari 2600 owners, which is to say that you probably know that Atari never called their \$200 monochrome games system console the "Atari 2600"; it was the "Atari Video Computer System", or more commonly, just "Atari 2600" e79caf774b
