Felbamate inhibits mitochondrial oxidative phosphorylation, and the inhibitors stimulate reactive oxygen species production from isolated mitochondria. The reaction mechanism(s) by which the antiepileptic drug, felbamate (2-phenyl-1,3-propanedione hydroxamic acid monohydrate) is metabolized to its active form(s), 2-phenylacetamide, remains unknown. In this work, felbamate was shown to inhibit the mitochondrial oxidative phosphorylation (OXPHOS) activity (spectrophotometrically determined) and the mitochondrial respiration (cytochrome c reduction assays) at the level of cytochrome aa3. The effects on the membrane potential, reactive oxygen species (ROS) production, and metabolism (succinate dehydrogenase activity) of isolated intact mitochondria from different tissues including kidney, liver, brain, heart, testes and skeletal muscle were investigated with 4-aminopyridine (a K(ATP) channel blocker), valinomycin (a K(+)-ionophore), antimycin A (cytochrome b-c1 inhibitor) and xanthine. The kinetics of cytochrome c reduction were found to be modulated by 2-phenylacetamide, and by felbamate. fel
