History Origin AutoCAD originated from several projects at the company Autodesk. The first was the Autodesk Viewer, a proprietary viewer for AutoCAD's graphics. In 1982, Autodesk released a viewer to complement the company's upcoming professional CAD product, AutoCAD. The AutoCAD viewer was simple, static and allowed only two people to work on the same CAD model at the same time. The company released a beta version of AutoCAD in the summer of 1982. However, since the graphics were limited and could only be viewed on a computer with an internal graphics controller, the early AutoCAD was a tool primarily intended for professional mechanical drafters. AutoCAD 1.0 AutoCAD 1.0, released in November 1982, was the first CAD software that was marketed to the general public and the first CAD software to be released for the personal computer. The release of AutoCAD 1.0 allowed the public to access the graphics and offered users a more familiar and comfortable user interface. It was priced at $1,995, compared to the $2,000-$3,000 CAD apps that were available at the time. AutoCAD 1.0's graphics were designed to run on an Apple II with a custom graphics board manufactured by Speed-Weld. This initial AutoCAD would be a client-server system in which the client would request a part from the server to create a new part. The server would then display the new part on the client's screen. The graphics were still crude and the original color could not be changed. The user interface was a cursor system where the mouse controlled the position of the cursor. The user had to select commands and turn on features one at a time. This meant the user had to remember which command was active when which feature was active. Also, the user could only move the cursor within the model view. It would not be possible to see the complete model at once. Shortly after the release of AutoCAD 1.0, Autodesk faced several problems with the Apple II sales. Due to the lack of sales and reduced profits, Autodesk decided to switch from the Apple II to the IBM PC platform in 1983. Since Autodesk was a profitable company, the switch was viewed as a risk. The company eventually turned to selling not only the AutoCAD viewer software, but also the original AutoCAD with the Viewer software included. The company

In recent years, treatment of hypertension by controlling blood pressure (hereinafter abbreviated to BP) with antihypertensive drugs has become common, and the number of hypertensive patients is therefore increasing. An increase in blood pressure not only leads to damage to the brain, but also reduces renal function. The impaired renal function may lead to hematuria and proteinuria, so that it becomes necessary to evaluate renal function for antihypertensive treatment. Furthermore, a reduction in renal function due to aging (hereinafter called "renal dysfunction") is a major cause of mortality. Therefore, a substantial decrease in BP is important for the prevention of end-stage renal failure and the improvement of survival rate. In particular, hypertension associated with diabetes is known to be a risk factor of diabetic nephropathy (a renal complication of diabetes), and therefore, effective control of hypertension is needed for the prevention of diabetic nephropathy. Thus, for the treatment of hypertension, it is important to control blood pressure in the same range as for the normal population. On the other hand, while it is important to control blood pressure, various antihypertensive drugs have side effects such as headache, orthostatic hypotension, nausea and vomiting, diarrhea, dry mouth, blurred vision, and bluish color of the urine. In particular, a decrease

in blood pressure to an extent which is not appropriate for the patients causes fatigue, nervousness and headache. The characteristics of an angiotensin II type 1 (AT1) receptor antagonist are as follows. (1) It can lower blood pressure at once, without causing headache, orthostatic hypotension, nausea and vomiting, diarrhea, dry mouth ca3bfb1094
