
New! 17 M 32 Siberian Mouse

Download

we found substantial genetic variation in bornean bv, including a quasispecies of bvdv-2 that probably resulted from extensive intragroup diversity (37). selection pressure was probably driving this diversity, as bvdv-2 variants with mutations in the c gene associated with increased growth in vitro (36) were associated with higher prevalence among animals in northeast borneo. the southeast bornean bvdv-2 variants differ at 16 positions from the southwest bornean variants. at least 3 recombinant events have occurred in bornean bvdv-2, probably resulting from reassortment between different lineages: a recombinant between bsdv-2 subgroup b and bvdv-2 subgroup c is found only in the southeast and central regions of borneo, a recombinant between bsdv-2 subgroup b and bvdv-2 subgroup e occurs throughout the island, and another recombinant between bsdv-2 subgroup c and bvdv-2 subgroup d occurs in the southwest. one recombination event appears to have occurred within the subgroup b allele itself. siberian hamsters have become more popular as research subjects than syrian hamsters as they are smaller (roughly 30-35 grams in weight) and easier to handle. the rat-like appearance of syrian hamsters makes them hard to handle for many researchers. syrian hamsters are larger (approximately 70 grams) and are generally more expensive to acquire. during the syrian hamster's maturation period, their diet should be supplemented with vitamin d, since sunlight is not a sufficient source of vitamin d. syrian hamsters require vitamin d supplementation on a daily basis throughout life in order to achieve the most optimal health and immune status. syrian hamsters should be maintained indoors during the mating and hatching season to avoid being compromised by outdoor predators such as coyotes and raccoons.
