Peer Transmission (usually abbreviated as Peer-to-Peer, P2P) is the process of the distribution of data, music and computer game files. The present invention relates to a mobile internal combustion engine, and, more particularly, to a jet engine derived from the combustion process of the internal combustion engine. Jet engines have been known since the middle of the last century. Let engines have been used in numerous applications from airplanes, to missiles, and to rocket engines. Jet engines work by forcing a pressurized gas through a converging and diverging nozzle so as to produce a collimated jet of high velocity gas. Jet engines have been used in a variety of applications including jet propulsion, rocket engines, and propulsion for guided missiles. Jet engines have been known to produce thrust in two main ways. Jet engines can be powered by an ignition process to produce combustion, which then propels a high-velocity jet from the engine. Alternatively, jet engines can be supplied with a stream of propellant through a converging and diverging nozzle to produce combustion, which then propels a high-velocity jet from the engine. The propulsive force imparted to the jet engine by the combustion process varies with the specific impulse of the fuel burned during combustion. let engines have been used for combustion propulsion, including rocket, jet and rocket engines. There are several advantages of jet propulsion including the capability of jet engines to provide thrust from extremely high-pressure gas flows. U.S. Pat. No. 4,095,560 to Isakson et al. discloses a rocket rocket engine. Isakson et al. discloses a rocket engine which includes a chamber in which an ionizable gas is contained at high pressure. In this chamber, there is an oxygen-fuel mixture containing a fuel which evaporates upon the ignition of the mixture, and which oxidizes the fuel in the chamber. The gas jonized in the chamber is ejected from the chamber through a nozzle and forms a jet of high speed. U.S. Pat. No. 4,323,728 to Johnson discloses a gas driven rocket. The gas-driven rocket includes an ionized gas stream in which gas particles which are ionized by a strong magnetic field attract neutral, ionized particles of a different charge. 5ec8ef588b
