now, researchers have found a candidate just a day old after the birth of the milky way. they found it in an area of the sky that, until now, had been a blind spot in the search for young star forming galaxies. supernovas are stellar explosions that can be witnessed by even us amateur stargazers. the supernova dmc 25 encompasses at least 3,000 light-years, or about 28 times the distance between earth and the sun, according to ign. in terms of sheer devastation, it ranks as the 5th most powerful out of 10,000 that have occurred throughout time, with its light expected to reach us in about 600,000 years. the milky way, which consists of a host of stars, nebulae and galaxies, can also contribute to influencing the life of another galaxy, says the bbc. the milky way is currently passing by the andromeda galaxy, which is also one of the largest galaxies in the universe. although the two galaxies are drifting apart from each other, there is the possibility for the milky way to impact the andromeda galaxy over the next few billion years. meanwhile, the milky way is pulling on the andromeda galaxy, causing the two galaxies to be pulled closer together, and therefore also causing the formation of new stars. ever since the launch of the herschel space observatory in 2009, scientists have been able to directly observe the birth of stars and their embryonic clouds of gas and dust. astronomers have now made a direct observation of the birth of one of the earliest stars in the universe, with the discovery of a newborn star in a cloud of gas in a galaxy called ic 4182. this star is estimated to be more than 1.1 billion years old.

## Dmc 25 Jav Milky Cat

the end of the last ice age around 10,000bce was a time of great upheaval for civilizations on land and sea. earth became a lot warmer - it was around 8°c warmer than it is now, which meant that sea levels rose significantly as glaciers began to melt, and much more rain fell than before. the climate changed so quickly that evidence of this transition is hard to spot in the archaeological record. this time, scientists looked at what was happening in the region of northern mongolia - one of the final locations before the glaciers that were responsible for the increase in temperature in the region melted away. they were able to find a set of 14 sites once covered by ice dating back nearly 40,000 years. first, the scientists located where the ice was melting, and then they observed what they could about the way people lived during the moment of change. what they discovered suggests that ancient people were actually better prepared for a warmer planet than we might have thought. many of the findings point to an unexpected uptick in human activity after the ice age, as humans may have begun to return to their traditional hunting and gathering ways to supplement their crops. the researchers discovered that people in the region at that time, before the end of the ice age, moved out of their hunting and gathering ways and began to live in more settled lifestyles like permanent agricultural settlements, an activity we associate with civilization. at this time, they were also buying and eating a much broader array of plant foods than they had done previously.
