## **What's New In?**

Mouse Mover is a lightweight and simple-to-use program which can imitate the movements of a mouse, thus allowing you to schedule automatic operations. It can be easily figured out, even by less

experienced users. This is a portable application, so installing Mouse Mover is not necessary. It means that you can store it on a USB flash drive or any other removable device, save it to any computer and directly run its executable file. This way, you can always have Mouse Mover with you when you're on the go. What's more important is that the Windows Registry is not updated with new entries, and no leftover files can be found on the hard drive after deleting the tool. The app is wrapped in a standard interface with an intuitive layout. So, you can select the window where you want the clicking to take place, and start making adjustments in regard to

the start delay, maximum movement, movement delay, as well as clicking delay and offset. The simplistic software tool runs on a very low amount of CPU and system memory, so it shouldn't put a strain on the computer's resources. It has a good response time but doesn't include a help file, unfortunately. Mouse Mover was stable throughout our evaluation, since it did not freeze, crash or pop up error dialogs. Some improvements concerning the UI are welcomed in the visual department. But we must acknowledge the fact that Mouse Mover has not been updated for a long time.
