Vertical Thermosiphon Design is a great app for the design of thermosiphons. It offers the ability to input the required information and produce a fully functioning thermosiphon design, using the calculus that is required to analyze the required indices. Features: - Perform required calculus of parameters, using a set of pre-calculated equations. - Identify the thermodynamics of parameters, using a variety of pre-calculated indices, or alternatively, create your own

index. - Calculate heat flow and thermal energy for a single thermosiphon, using two distinct indices. - Calculate heat flow and thermal energy for a two-stage thermosiphon, using four distinct indices. - Produce the heat transfer matrix of a single thermosiphon, using two indices. - Perform the required calculations and manage them on a tabbed layout, by grouping them according to required parameters. - Perform the required calculations and manage them on a tabbed layout, by grouping them according to required

**What's New in the?**

Vertical Thermosiphon Design  
(VTD) is an application designed  
with the aim of improving the  
thermosiphon design process,  
since a more comprehensive  
and user-friendly environment

has been created to tackle the task of mechanical, thermal, and economic feasibility. With VTD, users will benefit from a well-structured layout, which we believe enhances productivity by offering an unhindered view of all the parameters, at a single glance.

About Mitad Since its inception in 2011, Mitad has provided the industry with a strong suite of design-oriented software, to the benefit of its global clientele. By combining a strong project management background, with an experience of designing and building

thermosiphons, Mitad understands the need for a well-rounded suite of software, that helps in optimizing and maximising the energy efficiency of the devices.

MITAD software products are used by engineers, project managers and operators, in order to design and validate efficient thermosiphons and room heating systems. Mitad is a software manufacturer of products designed for the control, automation and management of heating, ventilation and air conditioning systems. The range of

application and widespread use of thermosiphons comes at the expense of their inherent complexity, especially pertaining to their design and corresponding calculations that are involved in it. Aside from performing manual design and calculus for such devices, users can rely on specialized apps, such as Vertical Thermosiphon Design (VTD). Just as its name aptly suggests, it will allow one to perform the required thermal calculus, for a wide range of indices and parameters, which are commonly involved in the design of thermosiphons.

Tabbed project layout, which offers enhanced accessibility and an overall effective handling Users will benefit from a well-structured layout, which we believe enhances productivity, by offering an unhindered view of all the parameters, at a single glance. All the project aspects will be offered through a tab-array, which is easily accessible, at all times. Each tab contains the corresponding calculus elements for the particular parameter, and users also have access to schematics and illustrations to some of the

indices and elements, for a better understanding of the underlying processes. Perform calculations for the required parameters and take one step further, through features that address more detailed aspects

The app's strong points go beyond the common parameters and their corresponding calculus, and offer a plethora of details that can be inputted and customized, in order to better reflect the required aspects. To that end, one will be able to access TEMA designation parameters, heat, and fluid characteristics, as well as

separate, independent exchanger details. To complement the said aspects, a built-in unit converter offers quick and efficient conversions at all times, from the main interface.
